Dear Sobekit team,

This is Documentation explain what I have done in the App

- I have created two views
  - First one for retrieving all users (Users).
  - The second for the Single user (SingleUser).
- And two components
  - The First one for Application Header and imported it into App to make it global before router view (AppHeader).
  - The second component is profile card to make code reusable and using props to send the data from users' view (UserCard).
- In the Vuex part fetching data using Axios to get data from dummy API into the store and using mapgetter to get data into component
- The router part using dynamic segment to render the current user ID
- For Plugins using BootstrapVue and fontawesome

You can find my code on github its public https://github.com/SayedAshraf/sobekit-app

App deployed on firebase
